     - JP58021497 A
       Mfr. of an additive for a detergent having a low bulk density
       comprises mixing an alkali salt powder of perborate having 200-600
       micron average particle size (A) with fine powder of a water-insol.
        inorganic material (B) having 0.1-100 micron average particle size in
        9/1-1/9 proportion by wt. in the presence of water corresp. to 25-45
       wt.% of the total wt. of the powders to cover the surface of the
       alkali perborate (A) with (B), and heating obtd. particles to at least
        200 deg.C. Pref. the bulk density of the detergent additive is
        0.15-0.50 g/cc. The water-insol. inorganic fine powder is CaCO3 or
        alumino-silicate.
      - Since the detergent additive is prepd. by allowing fine powders of
       water-insol. inorganic material on the surface of particles for
        serving as nucleus having reduced bulk density by swelling, the bulk
       density of the detergent additive is also small at almost the same
        level as the pulverous detergent itself. The additive can be uniformly
       mixed with the pulverous detergent causing no classification even if
```

it is subjected to vibration, etc. Since the additive is

- CPI: D11-B01 D11-B11 E31-E E31-P02 E34-D03

UP - 1983-11

water-soluble, the performance of the detergent is not deteriorated.
- Pref. perborate is sodium perborate. It is swollen by heating to at least 200 deg.C. Optimum degree of the swelling is attained when the particle size of the perborate is 200-500, (400-500)microns on average.
